1. Executive Summary

TutorAll is a web platform designed exclusively for San Francisco State University students to connect with qualified peer tutors across a variety of subjects. The goal is to simplify the tutoring process on campus by creating a centralized, secure, and easy-to-use website where students can browse verified SFSU tutors, view their subjects, hourly rates, and experience, then send a quick one-way message to request a session.

Many students struggle to find reliable academic help outside of class or don't know where to look for affordable tutoring options. Existing third-party services like Wyzant or Chegg Tutors are costly, cluttered, and don't focus on SFSU's unique academic environment. TutorAll solves this by creating a local, student-driven ecosystem that highlights SFSU tutors who already understand campus courses, professors, and grading styles.

The site's simplicity is its biggest strength. Users can search tutors by subject, see their listed rate, and contact them directly through a clean one-way messaging system that prevents spam and protects privacy. All payment details and scheduling are handled outside the platform, keeping TutorAll lightweight and focused purely on connection. The application is custom-tailored for SFSU and built with an intuitive interface aligned with the university's branding and accessibility standards.

Our development team is a group of senior computer science students passionate about improving the academic experience at SFSU. We are combining modern web technologies with user-centered design and feedback from students and faculty to deliver a platform that bridges the gap between those who need help and those who can provide it. TutorAll aims to make academic support at SFSU faster, safer, and more personal, a true student-for-students project.
